Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print. Papers are published as they are submitted and meet publication criteria. A unique citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon as they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B, 0C, 0D, 0E, 0F, 10-1Z, 20-2Z, etc.

The CID Number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages.

Enhancement of light extraction based on nanowire hyperbolic metamaterials in a grating structure [9883-29]

Multispectral inhomogeneous metasurface for emissivity control (Best Student Paper Award) [9883-32]

ADVANCES IN METAMATERIALS DESIGN

Engineering optical properties of semiconductor metafilm superabsorbers (Invited Paper) [9883-34]
Homogenization of spatially dispersive 1D fractal metamaterials [9883-35]
3D-stacked Ag nanowires for efficient plasmonic light absorbers and SERS sensors [9883-38]

NONLINEAR AND SPECIAL EFFECTS IN METAMATERIALS

Effective medium approximation for deeply subwavelength all-dielectric multilayers: when does it break down? (Invited Paper) [9883-43]
Transformation optics approach for Goos-Hänchen shift enhancement at metamaterial interfaces [9883-47]
Gold asymmetric-split ring resonators (A-SRRs) for proteins sensing [9883-48]

NOVEL CONFIGURATIONS AND PHENOMENA

Optical fiber meta-tips (Invited Paper) [9883-50]
Transforming guided waves with metamaterial waveguide cores (Invited Paper) [9883-51]
Improved optical amplification using metamaterial based split ring structures in optical fibres [9883-55]

POSTER SESSION

Analysis of 2D hyperbolic metamaterial dispersion by elementary excitation coupling [9883-58]
Varying the periodicity to achieve high quality factor on asymmetrical H-Shaped resonators [9883-59]
Authors

Numbers in the index correspond to the last two digits of the six-digit citation identifier (CID) article numbering system used in Proceedings of SPIE. The first four digits reflect the volume number. Base 36 numbering is employed for the last two digits and indicates the order of articles within the volume. Numbers start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B..., 1F, followed by 10-1Z, 20-2Z, etc.

The theoretical aspects concerning the propagation of homogeneous, inhomogeneous and leaky electromagnetic waves in uniaxial, dielectric waveguides have been of interest for some considerable time.1,2 The current metamaterial world, however, is still only partially served by investigations that set out to incorporate some form of general asymmetry into the behavior of hyperbolic metamaterials3,4. Stimulated by this situation, a dramatic change will be presented here by formulating a completely general approach to the constructive, and often unusual, positions that the optic axis position can adopt in such vital media. In the context of this work, it is acknowledged that an inspiration towards the dramatic development of the new pathways exposed here was reported some years ago5.

In order to sustain an investigation of how the orientation of the optic axis of a hyperbolic metamaterial affects guided waves, a thin film device will be examined and the optic axis will be permitted to adopt a wide range of interesting, and practical positions. The role of loss will also be estimated but this type of metamaterial is non-resonant, so loss will often not be competitive with the criticality of the optic axis orientation.

Clearly, the full control of light propagating in complex waveguides is an immensely important global topic so nonlinearity is a critically important tool for device creation. Indeed, in a nonlinear context, the use of metamaterials is seminal to the development of new devices. An initial nonlinear model will be developed and it will be shown that changes to the boundary conditions, due to the presence of effective media, permit even modest amounts of power to initiate elegant control of the effective group velocity. These outcomes will be strongly coupled to the optic axis-control in a manner that substantially modifies the dramatic linear investigations presented earlier on.

It will be emphasized that full control of solitonic metamaterial waveguides will need to be established through external influences, like a magnetic field, under the general heading of magnetophotonics. An outline of such a general optic-axis driven theory will be given. Finally, some pointers towards vortex formation in this new optic-axis driven environment will be critically commented upon because enhancing the addition of angular momentum to special light beams in this novel manner will also point to new, and important, devices, in the medical world for example.
